TV Advertising Performance and Attribution Analysis

Freya Li

Executive Summary

Key Findings

- TV airings drive **immediate and measurable traffic lift**, confirming real impact
- Performance varies significantly across networks, with **large efficiency gaps**
- Higher spend increases volume, but does **not guarantee better efficiency**
- June data appears incomplete and should be **excluded from decision-making**

Recommendations

- Reallocate budget toward networks delivering **both low CPA and strong traffic impact**
- Reduce or pause investment in **high-CPA or inconsistent networks**
- Combine survey attribution with traffic-response analysis to **improve measurement reliability**

Evaluating TV Performance: What Drives Efficient Growth?

Business Challenge

- TV spend is significant, but **efficiency varies widely across networks**
- Traditional attribution does not fully capture **TV's short-term impact on traffic**

Key Question

- Which networks deliver **efficient and scalable performance**?
- How does performance **evolve over time**?
- Do TV airings drive **measurable short-term traffic impact**?

Analytical Approach

- Integrated **performance and attribution** data to evaluate efficiency and impact
- Analyzed **network-level performance, time trends,** and **post-airing traffic response**

Data Preparation and Methodology

Data Preparation

- Standardized and integrated campaign, survey, and network data into a unified dataset
- Constructed core performance metrics (CPA, CR, CPM) to evaluate cost efficiency and conversion
- Cleaned and adjusted data to handle missing, zero-division, and incomplete observations

Attribution Preparation

- Aligned TV airing timestamps with subsequent website traffic at a granular time level
- Estimated short-term incremental traffic lift following each airing
- Built a framework to isolate TV-driven impact beyond baseline traffic

Outputs

- Developed separate performance and attribution views to evaluate efficiency and impact
- Delivered interactive dashboards to support network-level comparison and decision-making

01

Performance Analysis

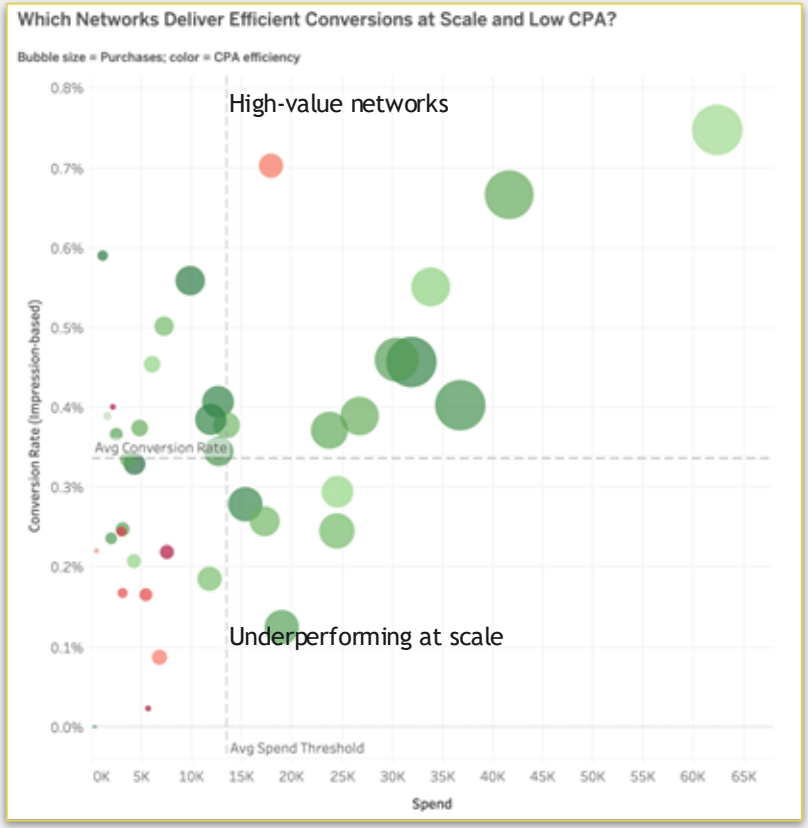
Overall TV Performance Shows Scale, but Masks Network-Level Variation

Total Spend	Total Purchases	Overall CPA
$554K	8K	$69.17
Overall CPM	**Overall CPV**	**Overall CR**
$2.41	$4.93	7.13%

Key Insights

- **~$554K** spend / **~8K** purchases → **clear operating scale**
- **~$69** CPA → TV can drive **measurable acquisition**
- Performance is **not uniform** — aggregation hides network-level differences
- Optimization requires **network-level breakdown**

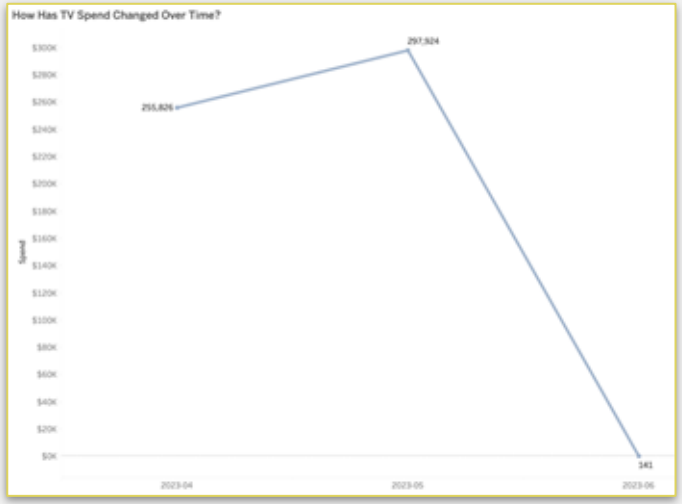
Performance Is Concentrated — Only a Few Networks Deliver Both Scale and Efficiency

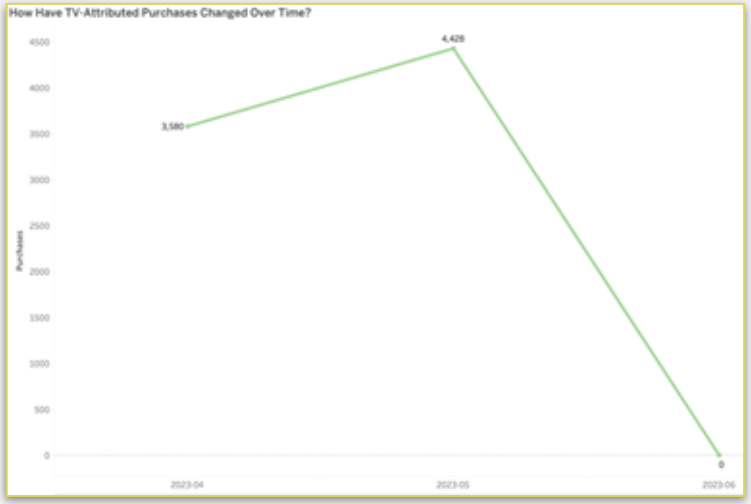


Key Insights

- Performance is concentrated in a **small set of high-value networks**
- **Efficiency and scale do not consistently align** across networks
- Several **high-spend networks** deliver **below-average efficiency**
- **Budget reallocation toward top-performing networks** could improve **overall ROI**

Performance Improved from April to May, While June Appears Incomplete

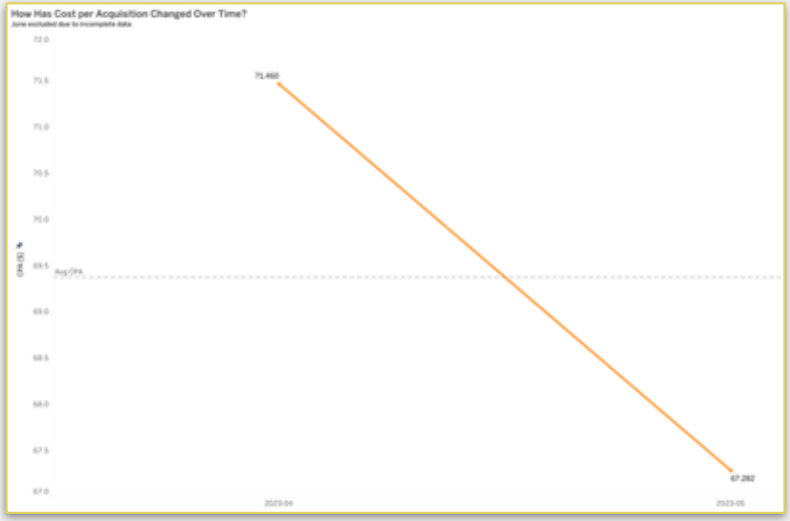


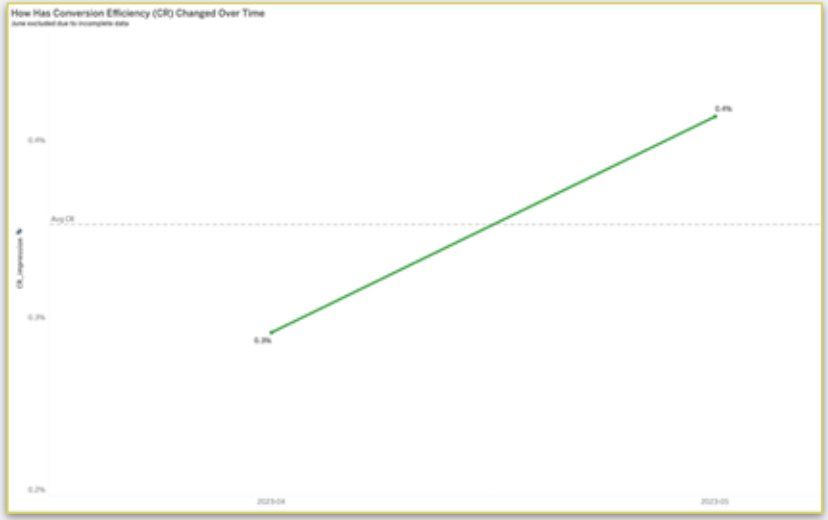


Key Insights

- Spend increased from April to May, with a **clear increase in purchases**
- TV investment translated into **higher overall conversion volume**
- June activity appears **incomplete, not indicative of a real decline**

Efficiency Improved from April to May: Lower CPA and Higher Conversion Rate





Key Insights

- **CPA decreased** from April to May, indicating improved cost efficiency
- **Conversion rate increased** over the same period, showing stronger conversion effectiveness
- Together, this suggests TV spend became more **efficient**, delivering more conversions at **lower cost**

Large Efficiency Gap Across Networks Reveals Clear Reallocation Opportunity

April Performance

Top

Month	comedy central	ifc	viceland	women's entertainment	tennis channel	bloomberg television
2023-04	43.1	49.8	51.3	55.4	55.6	58.7

Bottom

Month	bravo	headline news	cnn	golf channel: pga tour	oxygen	golf channel
2023-04	265.6	151.6	117.9	116.4	113.2	94.9

May Performance

Top

Month	reelz	tennis channel	tenn: french open	viceland	paramount: yellowstone..	hallmark movies & my..
2023-05	35.7	40.4	41.9	42.4	43.9	47.5

Bottom

Month	abc:	freeform	msnbc	espn 2	fxx	fyi
2023-05	629.6	566.0	135.6	134.8	132.4	130.3

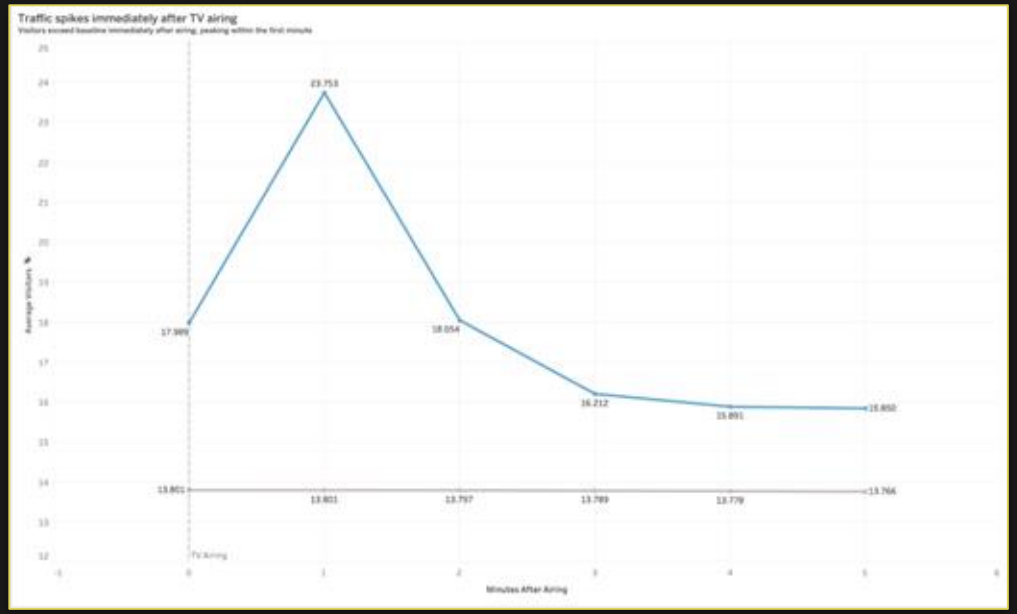
Key Insights

- Top networks deliver acquisitions at **less than half the cost** of underperforming networks
- Several networks exhibit **extremely high CPA(>$130)**, indicating inefficient spend allocation
- The consistent gap across both months suggests **systematic performance differences**, not short-term variation
- Reallocating budget toward top-performing networks could **significantly improve overall efficiency**

02

TV Attribution Analysis

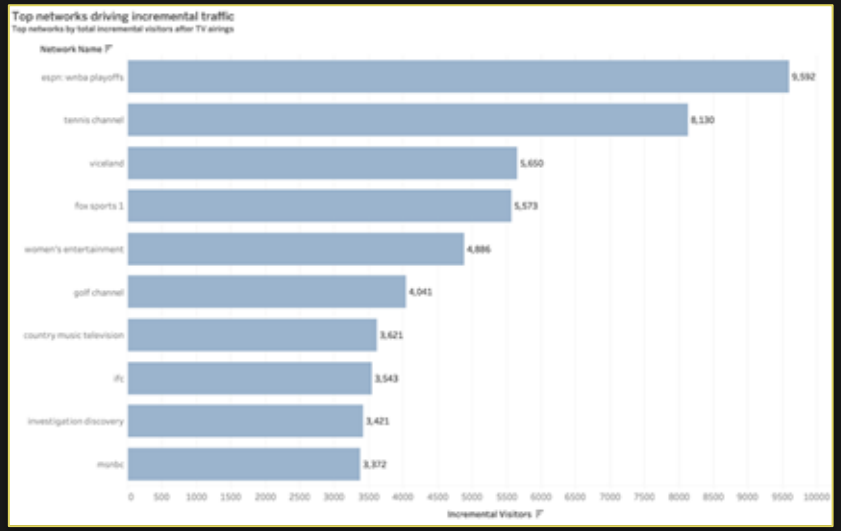
TV Airings Drive Immediate and Measurable Traffic Uplift

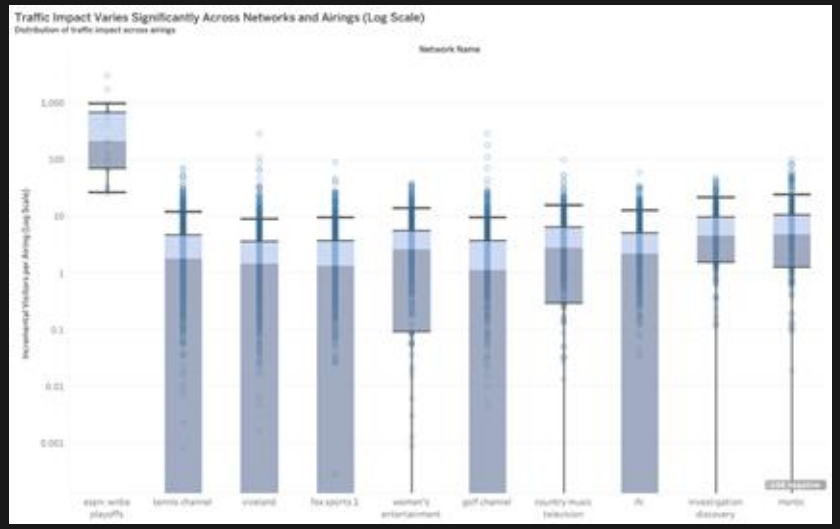


Key Insights

- Website traffic increases **immediately after TV airings**, **peaking** within the **first minute**
- Visitors consistently exceed **baseline levels**, indicating real **incremental impact**
- The immediate spike suggests a causal relationship **between TV exposure and online engagement**
- This provides strong directional evidence that **TV advertising drives measurable traffic**

Traffic Impact Varies Significantly Across Networks





Key Insights

- A small number of networks account for a **disproportionate share of total traffic**
- Performance varies across airings within the same network, indicating **inconsistent impact**
- This suggests **network selection is critical, a**s it directly affects overall TV ROI

Recommendation & Next Steps

Budget Allocation

- Reallocate budget toward top-performing networks that deliver both **low CPA and strong traffic lift**
- Reduce or pause spend on high-CPA networks unless performance can be improved

Network Strategy

- Prioritize networks with **consistent performance across airings**, not just high averages
- Test and scale networks that show both efficiency and stability

Measurement Improvement

- Combine survey attribution with traffic-response validation to improve reliability
- Exclude incomplete periods (e.g., June) from optimization decisions
